Voya × Agoda · Android

Designing the hotel cancellation flow.

A self-serve cancellation experience for an Android hotel-booking app, built on Agoda's Demand API — with one promise to the traveller: **no surprises about the refund.**

cancel with confidence

PM101 · Mid-Course Case | Masters' Union | Oct 25, 2026 | Team · Member 1–5 · Group X

WHY THIS MOMENT MATTERS

The most anxious step in travel — and our best chance to earn trust.

😣 The problem

Users can book in Voya but can't **cancel** in Voya. When plans change they call support or dispute with their bank — cost, chargebacks, churn, and a lost trust moment.

🎯 The goal

Let users cancel themselves, seeing **exactly** what they'll be refunded and when — *before* they commit. The refund shown is the refund paid.

★ North star

"No surprises." Transparency over optimism — we trade a few completed cancellations for far fewer disputes and far more repeat bookings.

HOW WE'LL KNOW IT WORKED

↗ Self-serve rate

Share of cancellations done in-app without support.

↘ Tickets & disputes

Cancellation tickets and refund chargebacks fall.

◎ Preview drop-off

Where trust breaks — the make-or-break screen.

↻ Rebooking rate

Revenue recovered right after a cancellation.

ASSUMPTIONS & SCOPE

What we're designing — and what we're deliberately not.

1. **Partner Fulfillment.** Voya owns payment + post-booking (incl. cancellation) via Agoda.
2. **Full cancellation** of one confirmed, prepaid booking made in-app.
3. **Booking linkage.** Each booking stores Agoda's `bookingId` mapped to the user.
4. **Server-authoritative refund.** Amount comes from Agoda's Preview call, never computed on device.
5. **Refund to origin.** Settled by Agoda/rails; Voya surfaces status only.
6. **Re-auth** (biometric) gates the destructive confirm step.
7. **Locale.** Booking currency; deadlines in hotel local time.
8. **Window.** Cancel up to 1 day before check-in, per Agoda; else assisted.
9. **Idempotent confirm.** Agoda `reference` + our key — never double-cancels.
10. **~120 s SLA** tolerated via a processing state & async `PENDING`.

Out of scope · v1

- Date / room **modifications**
- **Partial** (per-room / per-night) cancel
- No-show handling
- Group / corporate bookings
- Agent / offline cancellation

Captured as future scope in the PRD.

INFORMATION ARCHITECTURE

Where cancellation lives — and how users reach it.

Entry points

1. Trips › Upcoming › Booking Details › Cancel **2.** Account › Help › "Cancel a booking" **3.** Deep link from confirmation email / push.

Hero priority order

① Refund amount + math → ② deadline / policy → ③ what's cancelled → ④ reason → ⑤ outcome-stating CTA.

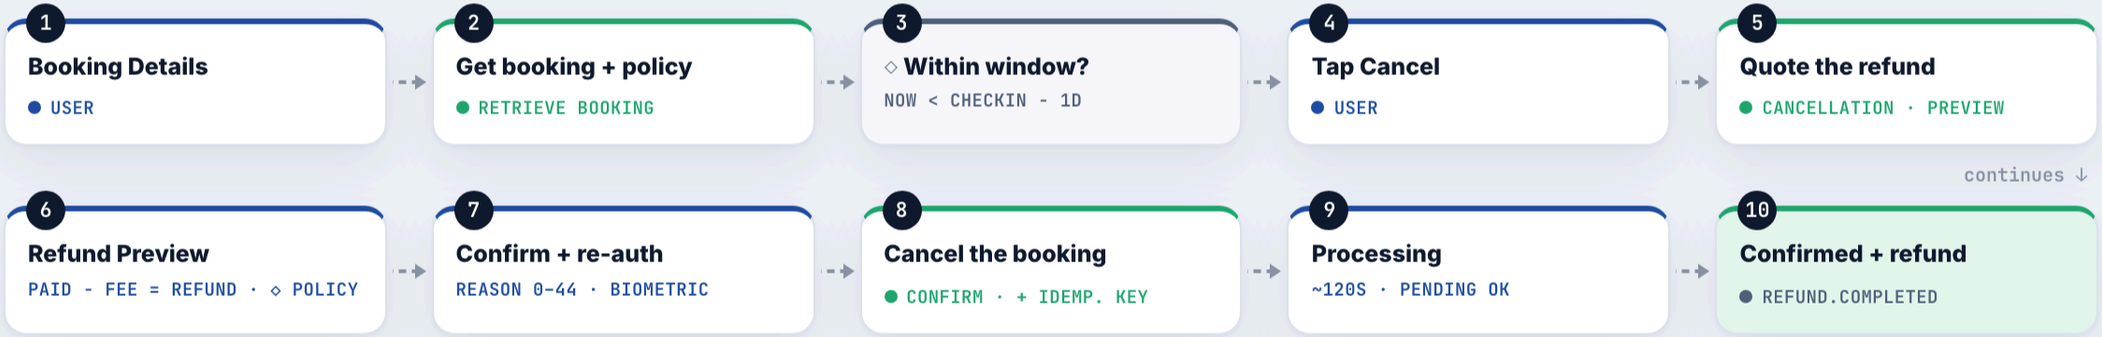

Information it moves

In: booking + policy (Retrieve), refund quote (Preview). **User:** intent, re-auth, reason. **Out:** cancel command (Confirm) → refund status + receipt.

FLOW OF LOGIC + INFORMATION

End-to-end, across three systems.

● User (app) ● Voya backend ● Agoda Demand API ● Exit / assisted

◇ **Within window? — No** → assisted / fee-waiver (step 3)

◇ **Result — error** → retry (same reference) / support (step 8)

◇ **Confirmed** → refund status tracker · rebook nudge (step 10)

● User ● Agoda API — refund is always Agoda's number; Confirm carries the Preview `reference` + our idempotency key. Source: `flows/cancellation-flow.mmd`.

— THE INTEGRATION SURFACE

Every screen is one Agoda call away.

SCREEN	AGODA CALL	KEY DATA
My Trips / Details	`Retrieve Booking`	status, cancellationPolicy
Refund Preview	`Cancellation · Preview`	→ reference, refundRate
Confirm + re-auth	`Cancellation · Confirm`	cancelReason 0–44
Processing	`await / poll`	PENDING ~120s
Confirmed	`refund.completed`	ref, amount, ETA
Past window	`Fee-Waiver`	assisted route

Auth DOCUMENTED

`Authorization: <Site-ID>:<API-Key>` (or OAuth 2.0). IP-whitelisted. Bad creds → `error 108`.

Two-step cancel DOCUMENTED

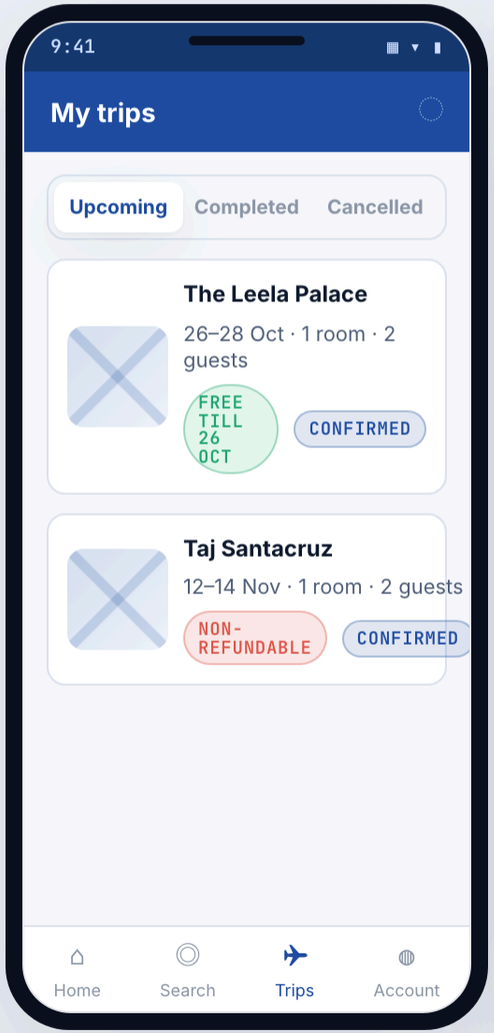

Preview returns a `reference` you must pass to Confirm — it binds the confirm to the exact refund shown.

```
# Preview → powers the refund screen POST
/cancellation/preview Authorization: 123456:****-****-**** {
"bookingId": 889001234 } # 200 { "cancellationSummary": {
"reference": 70421, "refundRate": [{ "currency":"INR",
"inclusive": 18240.00 }] }} # Confirm → the destructive
action POST /cancellation/confirm Idempotency-Key: voya-cxl-
889..-9f2a { "bookingId":889001234, "reference":70421,
"cancelReason":7, "refundRate":{ "currency":"INR",
"inclusive":18240.00 } } # → 200 empty (or PENDING)
```

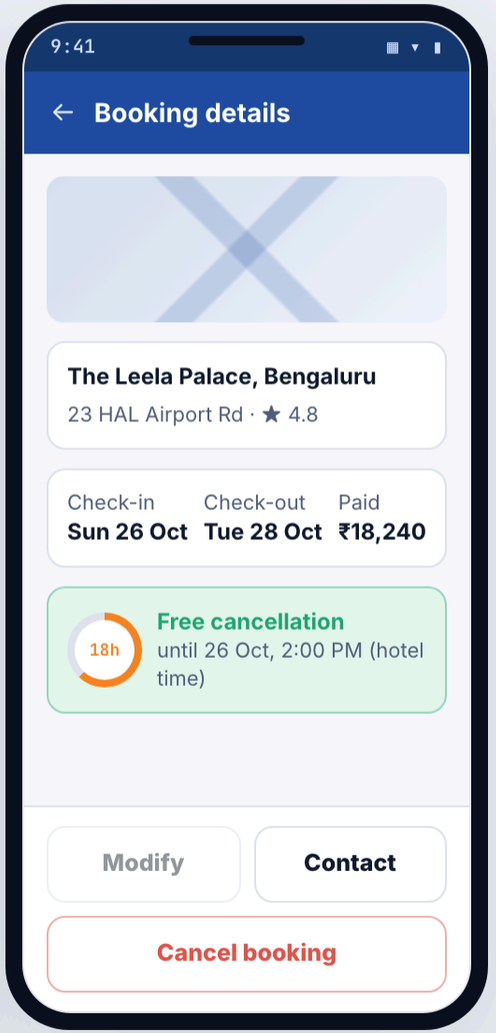

DOCUMENTED field names from Agoda's public Demand docs · INFERRED exact paths + refund webhook. Full map in `docs/api-integration.md`.

— WIREFRAME ① — FINDING THE BOOKING

My Trips → Booking Details.

01 · MY TRIPS

02 · BOOKING DETAILS

🎨 DESIGN · UI/UX

"Cancel" is present but not the loudest control. The **free-cancel deadline shows on the card itself**, so the user sees it before drilling in — with a countdown ring inside the window.

⚙ DEVELOPER · API

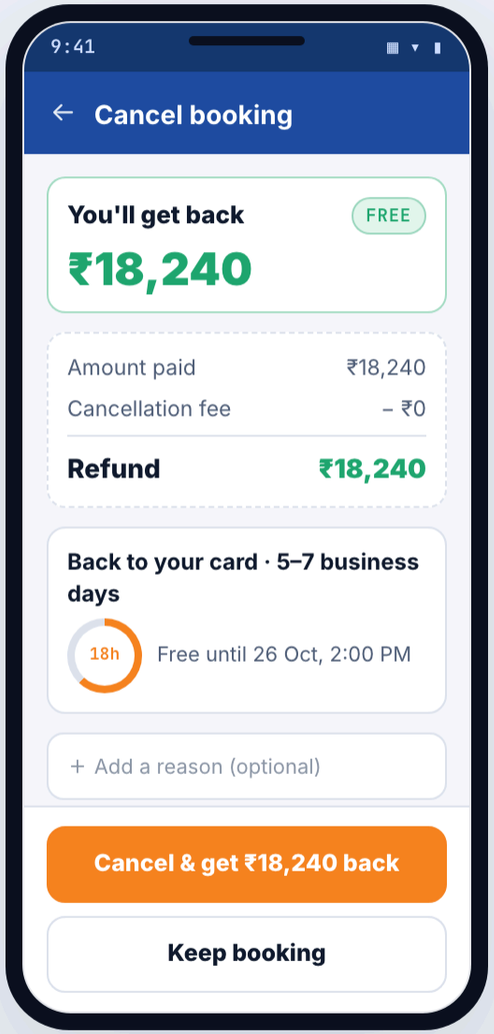

List from cache, reconciled with `Retrieve Booking` → `status` + `cancellationPolicy{date[]}` ; deadline derived from `date[]` . Guard: if `now ≥ check-in - 1d` → assisted route.

📈 BUSINESS

Surfacing the deadline early nudges users to cancel **inside the free window** → fewer penalties and "why was I charged?" tickets. Best place to offer "modify instead".

— WIREFRAME ② — REFUND PREVIEW

The make-or-break screen: show the money, then ask.

03 · REFUND PREVIEW

🎨 DESIGN · UI/UX

Refund amount is the hero; the **math is explicit** (Paid – Fee = Refund). Policy in plain language, CTA states the outcome. Reason is never a gate.

⚙️ DEVELOPER · API

Call `Cancellation Preview {bookingId}` on entry → render `refundRate` (**server truth, never computed**). Hold `reference` for Confirm; refresh if the quote goes stale.

📈 BUSINESS

Transparency here is the biggest lever on disputes & chargebacks. Instrument drop-off. Non-refundable → offer **travel credit** (fast-follow) to save CSAT.

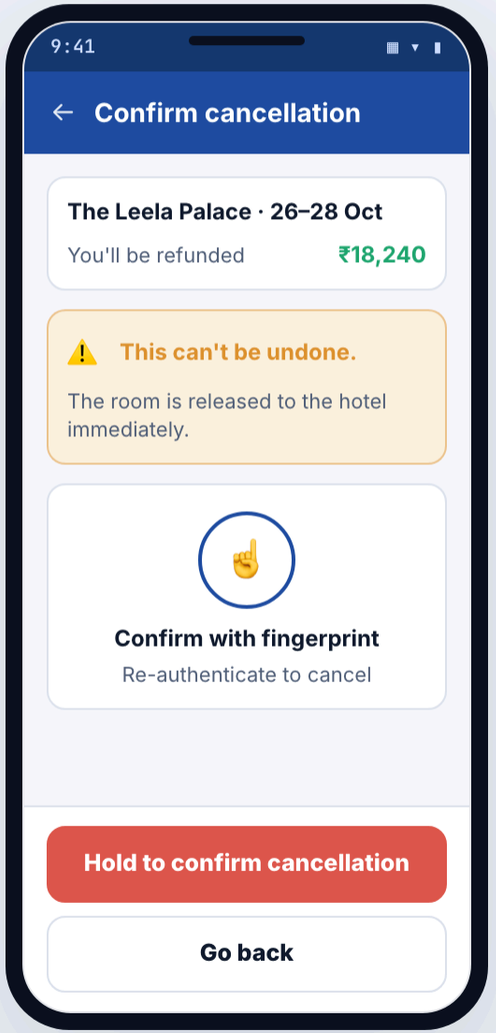

● **Free**
₹18,240
Inside the window — full refund. CTA: "Cancel & get ₹18,240 back".

● **Partial**
₹12,768
Penalty tier applies (–₹5,472). Show paid – fee clearly. CTA names the net refund.

● **Non-refundable**
₹0
Calm, honest warning (not alarm-red). CTA: "Cancel — no refund". Offer credit later.

— WIREFRAME ③ — THE DESTRUCTIVE STEP

Deliberate confirmation, with re-auth.

04 · CONFIRM + RE-AUTH

🎨 DESIGN · UI/UX

One last plain summary + an **honest "can't be undone"**. Re-auth and a **hold-to-confirm** (not a stray tap). Easy back-out always visible.

⚙️ DEVELOPER · API

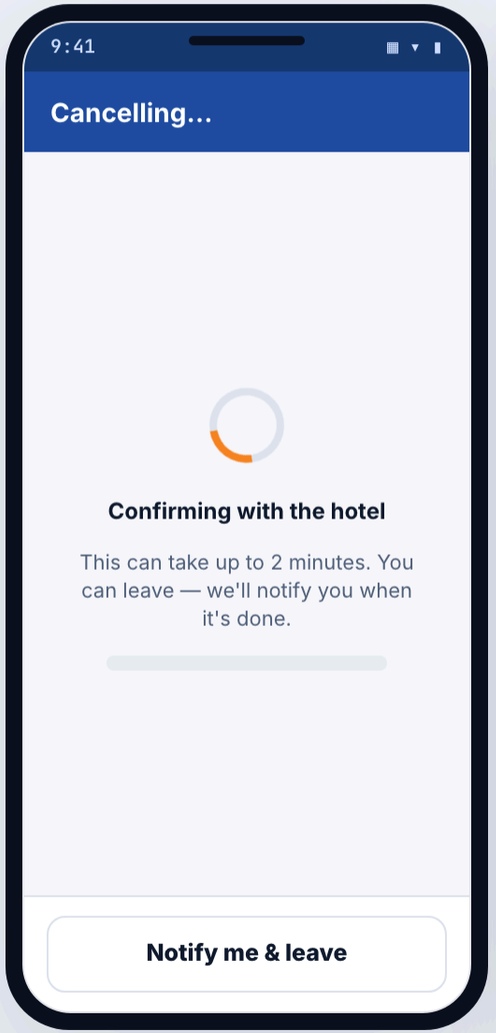

`Cancellation Confirm {bookingId, reference, cancelReason, refundRate, remark?}` + our **idempotency key**. Map reason → `cancelReason` 0–44. Retry-safe.

📈 BUSINESS

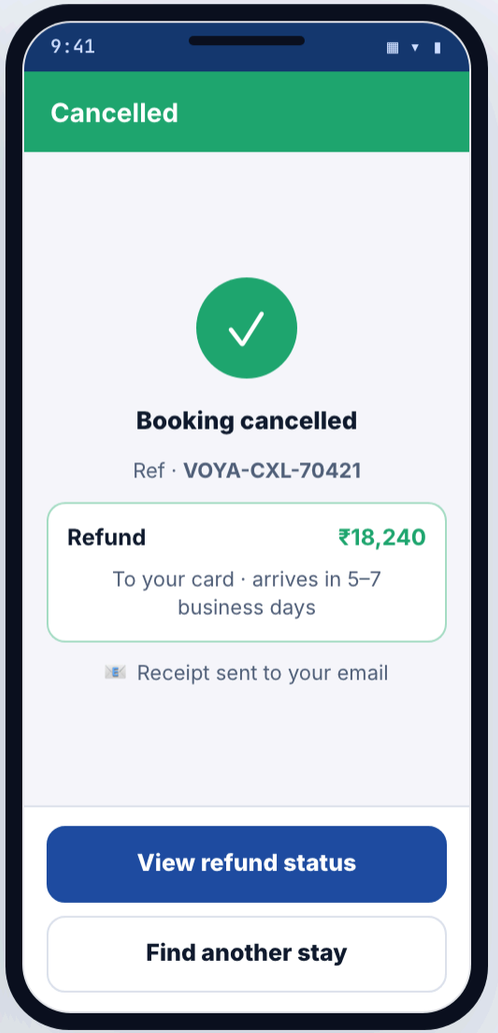

Deliberate friction prevents regret cancellations & fraud. Reason codes feed analytics and supply insight back to Agoda.

— WIREFRAME ④ — THE WAIT, THEN RELIEF

Honest processing, then a trust artifact.

05 · PROCESSING (~120S)

06 · CONFIRMED

🎨 DESIGN · UI/UX

Processing shows progress + reassurance and **lets you leave** — never an infinite spinner. Confirmed leads with the **refund timeline**, the real anxiety-reliever.

⚙️ DEVELOPER · API

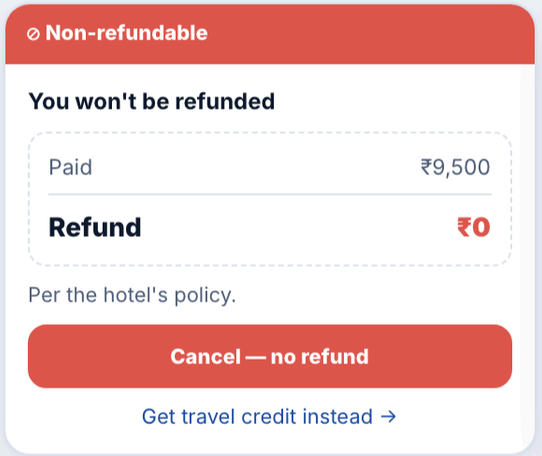

Await Confirm; on `PENDING`, poll refund status / await webhook `refund.completed`. Persist `cancellationId`; send email/push; move booking to Cancelled.

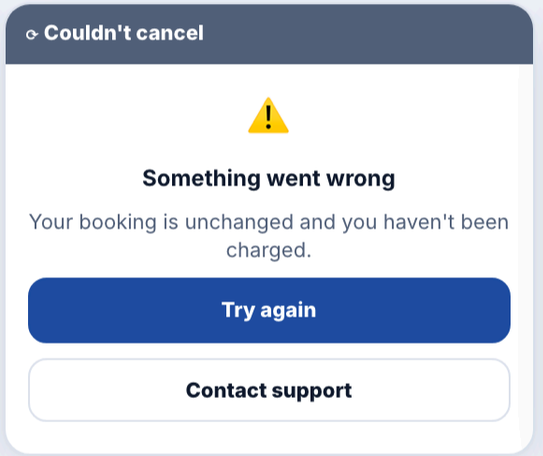

📈 BUSINESS

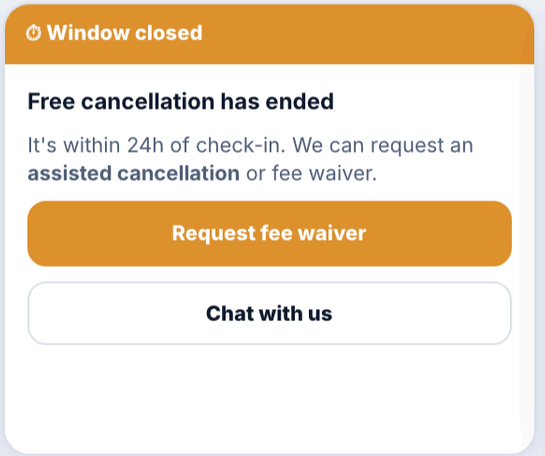

Confirmation deflects "did it work?" tickets; the **rebook CTA recovers revenue**; track refund-SLA adherence.

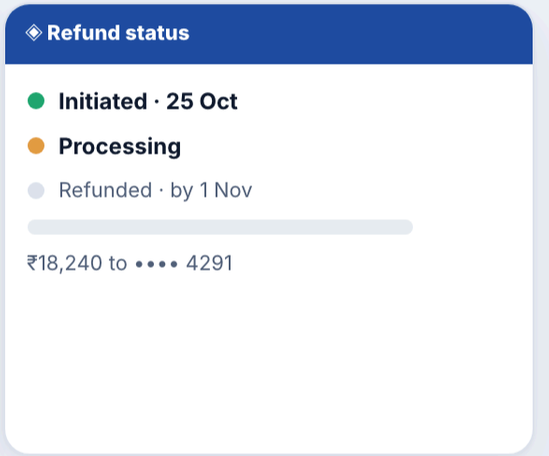

— WIREFRAME ⑤ — THE UNHAPPY PATHS *THIS IS THE REAL PRODUCT*

Every failure has a next step.

🎨 **DESIGN**

No dead ends — plain-language errors, each with a clear action. Non-refundable stays calm; status tracker answers "where's my money?".

⚙ **DEVELOPER**

Map Agoda `errorMessage{id,subId,message}` + `error 108` ; retriable vs terminal; **idempotent retry** (same `reference`); graceful offline.

📈 **BUSINESS**

Good failure UX = fewer chargebacks and calls. Track failure reasons to fix the top causes; fee-waiver protects goodwill.

PRODUCT NOTE · THE FLOW & THE THINKING

Built around one promise: no surprises.

The moment

Cancellation is the most emotional step in travel — plans fell through, money's at stake, a fight half-expected. Make it clear, fast and honest and a *negative* moment becomes a reason to trust us and rebook. Make it opaque and users call support, dispute with the bank, and leave one-star reviews.

The flow

Booking Details → **Cancel** → we call Agoda **Preview** and show the refund math, method, ETA and a live deadline countdown — the number is **Agoda's, not ours**. The screen adapts to Free / Partial / Non-refundable; the CTA states the outcome. Continue → optional reason → **Confirm + re-auth** → Agoda **Confirm** (with `reference` + idempotency key) → honest **Processing** (~120s, async-tolerant) → **Confirmed** with reference, refund & timeline, plus a receipt and status tracker.

Why these choices

- **Transparency over optimism** — show the real refund up front; lose a few cancels, save far more in disputes.
- **Server-authoritative money** — Agoda's number, surfaced, never recomputed on device.
- **Deliberate friction** — re-auth + outcome-stating CTA protect users from regret & fraud, without feeling like a trap.
- **Designed for the unhappy path** — the policy branches and error states *are* the product; the happy path is the easy 20%.

---

the refund shown is the refund paid.

WHAT WE'LL WATCH · RISKS · WHAT'S NEXT

Ship v1, learn at the Preview screen, then go deeper.

We'll watch

- Self-serve cancel rate
- Cancellation tickets ↓
- Disputes / chargebacks ↓
- **Preview drop-off** (make-or-break)
- Refund-SLA adherence
- Post-cancel rebooking · CSAT

Risks & open Qs

- Exact Agoda REST paths + refund-status/webhook channel to confirm
- Non-refundable = satisfaction cliff → travel-credit
- Deadline timezone correctness (hotel local time)

Roadmap

- **v1** this flow
- **v1.1** refund-status push · "modify instead"
- **vNext** partial / per-room cancel · non-ref → travel credit · group bookings
