Hotel booking cancellation: Android app

Wireframes, information architecture and logic flow for Voya, built on Agoda's Demand APIs

The problem

Voya sells hotel rooms that come from Agoda. When a traveler needs to cancel, they want to know what it will cost and whether the cancellation went through. Voya does not set the refund; it has to ask Agoda, show the answer clearly, and recover safely when a call is slow or fails.

User goal

Cancel a confirmed booking from the app, see the estimated refund before agreeing, and know the result.

Voya context

An early-stage Android app with no direct hotel contracts. Hotel content and prices come from Agoda. Voya books on the traveler's behalf and, we assume, takes payment and handles service after the sale (Agoda's Partner Fulfillment model).

Data in this document

Hotels, prices, dates and booking IDs are simulated test data, not real reservations or live Agoda responses. The demo date is Sunday 25 October 2026.

What is in this document

2	Scope, assumptions, evidence legend
3	Information architecture
4	Logic and information flow, four lanes
5 to 10	Wireframes A to P with design, developer and business notes
11	API-to-screen map and key scenarios
12, 13	Product note

Course and team

PM101 Mid-Course case, Masters' Union, October 2026.
Team: Om Umrania, Param Parekh, Shabareesh Parlakota, Arushi Gupta, Manya Mahajan.

Scope, assumptions and evidence legend

Every claim on later pages is tagged so it can be traced to Agoda's documentation or to a Voya decision

In scope (version 1)

- Full cancellation of one confirmed booking, from My trips
- Refund preview, final confirmation, result
- Unknown outcome after a timeout
- Fee waiver, only when permitted
- Support route when the app cannot cancel

Out of scope

- Date changes
- Cancelling one room of several
- No-show disputes
- The payment system that returns money

Evidence legend

`D` Documented on the Agoda page cited

`A` Voya assumption or design decision

`V` Unclear or undocumented; validate with Agoda

Assumptions

1. Voya uses Agoda's Partner Fulfillment model: Voya takes payment and handles service after booking. `A`
2. Voya keeps its own booking reference beside Agoda's bookingId. My trips reads Voya's database, not Agoda directly. `A`
3. Voya's Agoda account may call Cancel Preview, Cancel Confirm and fee waiver. `V`
4. The cancellation policy from Search (cancellationDetail) is saved at booking and shown as a reminder only. Live Preview gives the quote. `D` `A`
5. In the examples the traveler paid what Agoda quotes: price and currency parity. No Voya markup, coupon or FX. `A`
6. Voya's payment gateway sends the traveler's refund. Agoda does not document refund timing for this model. `A` `V`
7. The date a fee starts is separate from the date the API stops allowing cancellation. The latter is documented two ways (one day before check-in, or 12:00 AM on the check-in date). `V`
8. Support can cancel by hand and receive a booking reference. Designed here, not built. `A`

Illustrative data

Sample Hotel, Bengaluru. Check-in Thu 10 Dec 2026, check-out Sat 12 Dec 2026. Voya ref VY-1042, paid ₹18,240. Fee-free until Mon 7 Dec 2026, 6:00 PM hotel time.

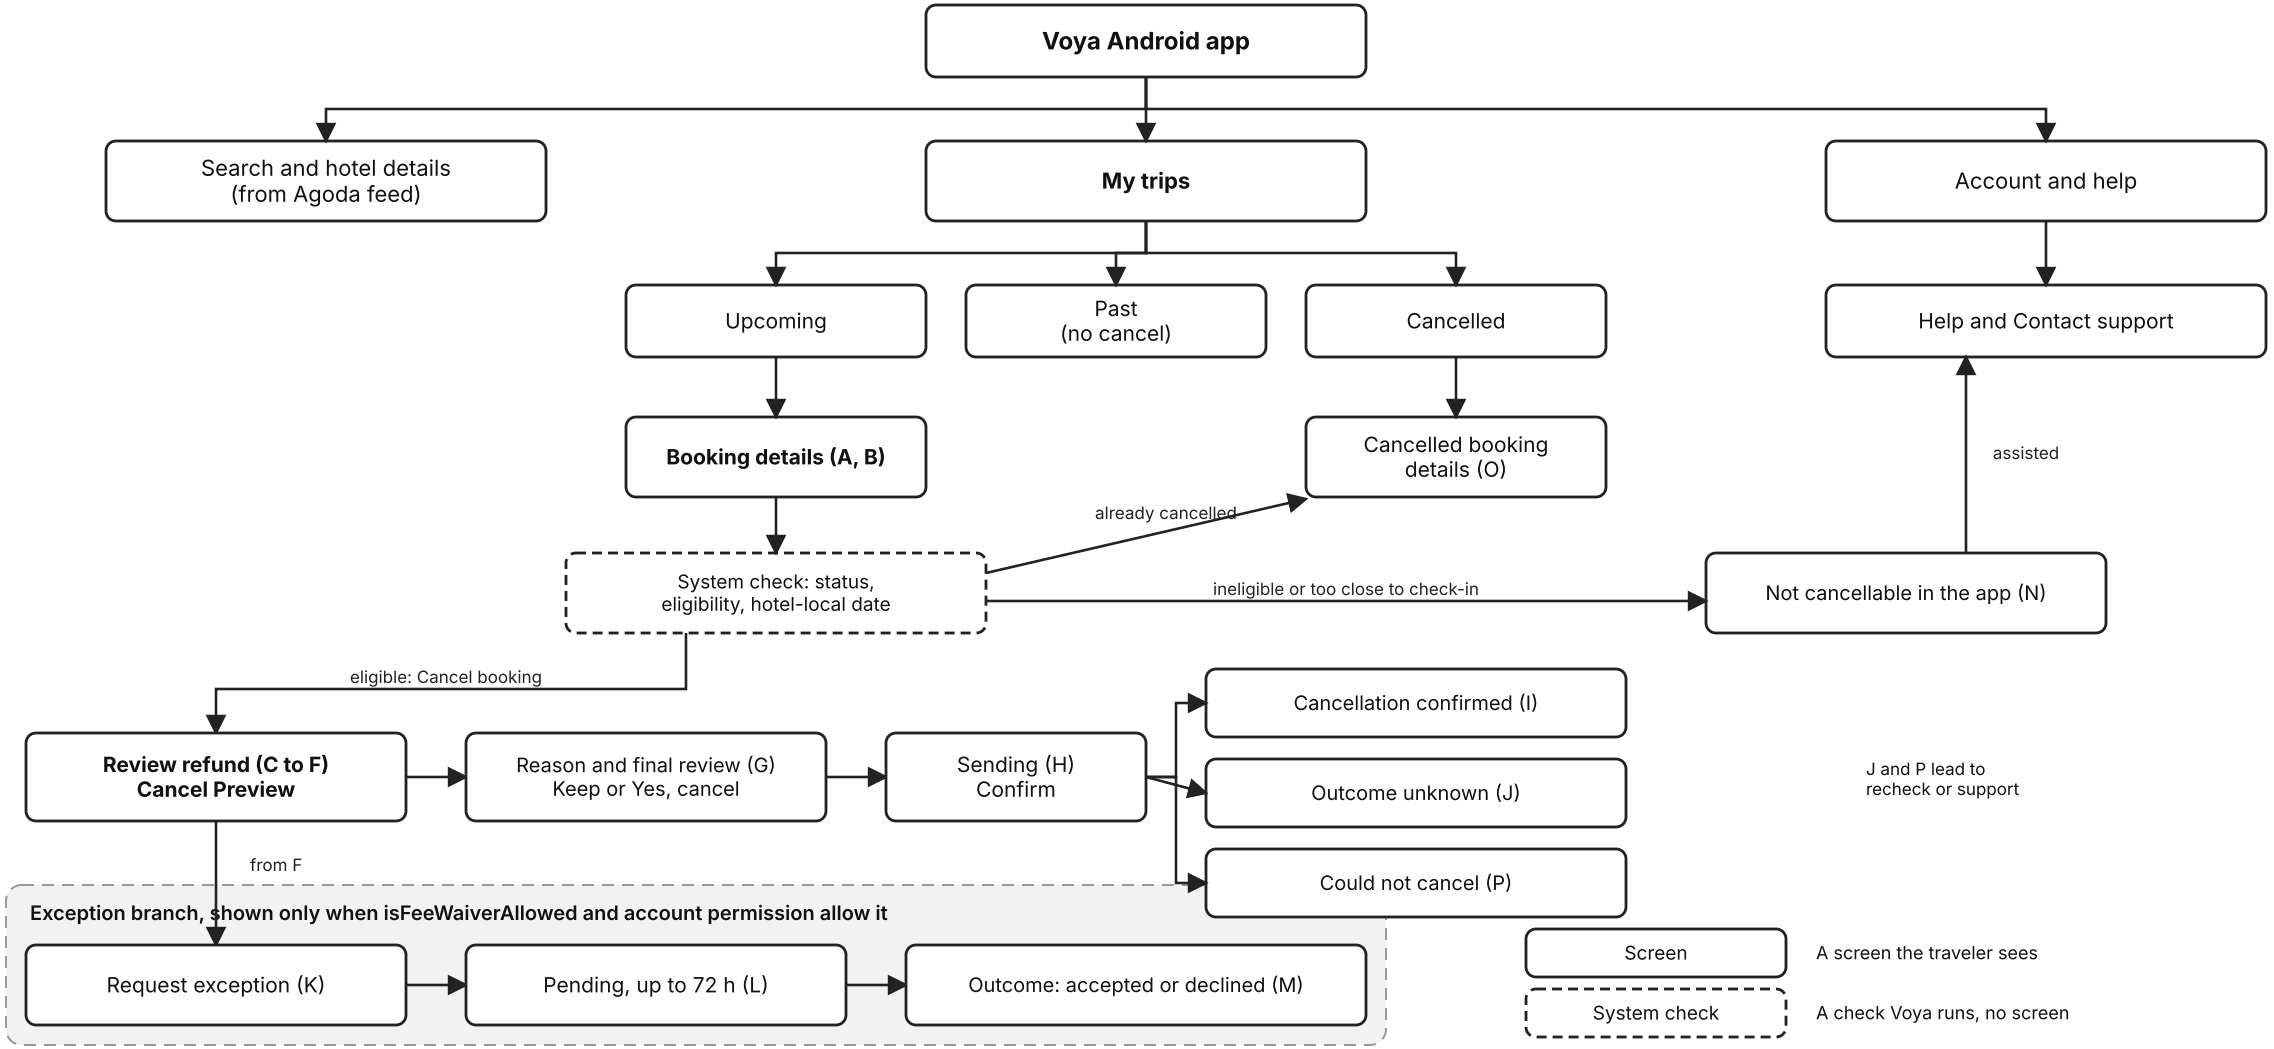

Three separate fixtures drive the refund screens: full refund ₹18,240 (VY-1042), partial ₹12,000 (VY-1057), none ₹0 (VY-1063). They are not three prices for one booking, and none is Agoda data.

Information architecture

Navigation tree for cancellation. Screens are solid boxes, system checks are dashed

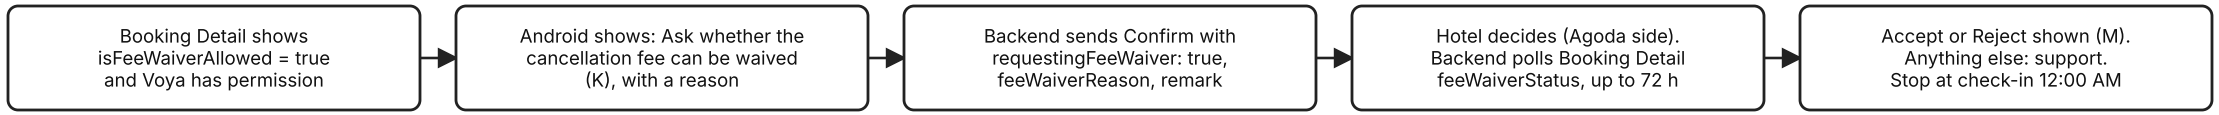

Logic and information flow

Who knows what, and when. Agoda calls are in the Agoda lane; everything else is Voya's own logic [A]

Fee waiver branch (conditional)

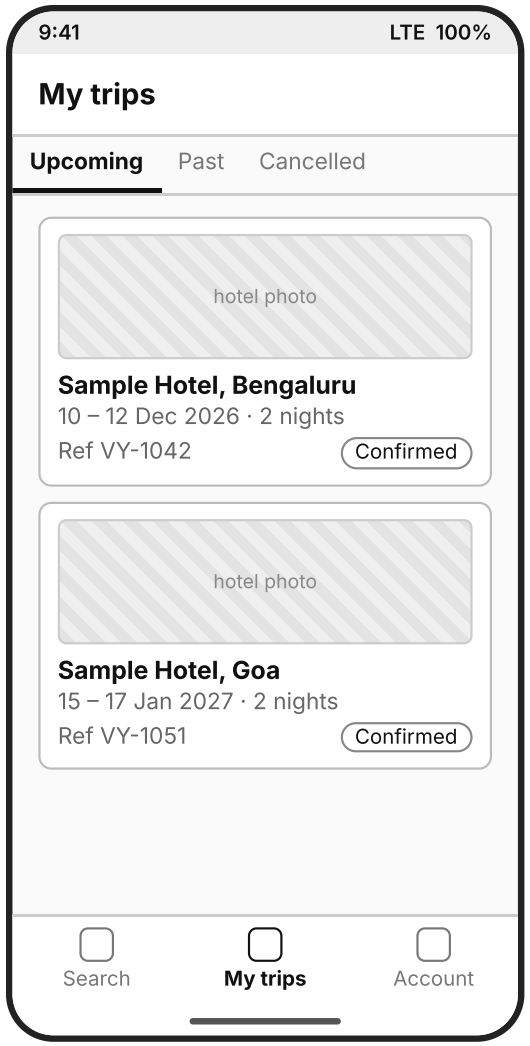

If Confirm gets no reply, step 12 runs before any retry. Preview and Confirm can each wait up to 120 s D

Wireframes A and B: My trips and Booking details

Entry point and the place where cancellation starts

A My trips Fixture VY-1042 and VY-1051

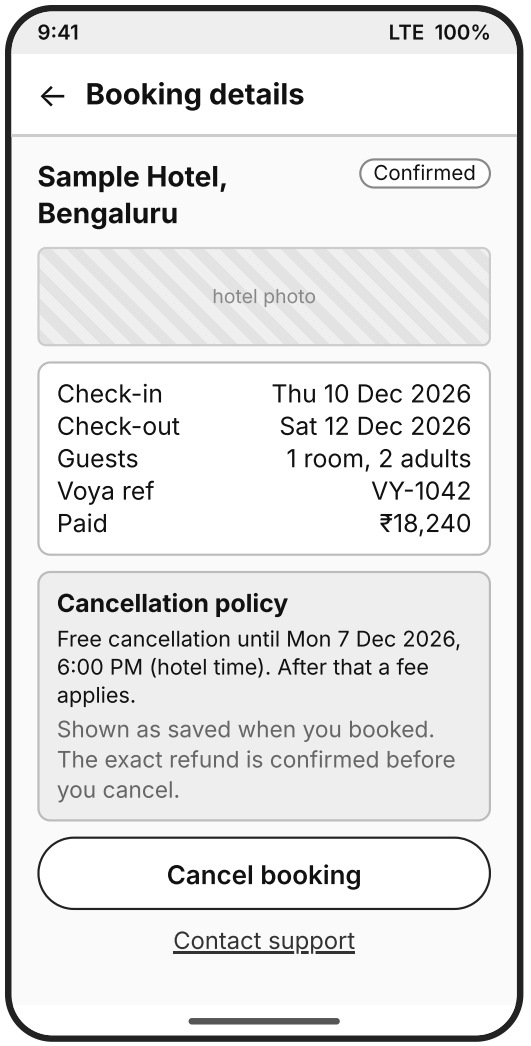

DESIGN (UI/UX)
Upcoming trips come first. Each card carries hotel, dates, Voya reference and status so the right booking is easy to pick. Cancelled trips have their own tab.

DEVELOPER (API)
A The list is read from Voya's own booking table, which stores Agoda's bookingId next to the Voya reference. D Booking List can look up bookings by recent window or partner tag, so Voya uses it to reconcile missing records, not to build this screen.

BUSINESS
A Cancelling starts from a screen travelers already use. Because Voya owns the record, trips still show if Agoda is slow or unreachable.

B Booking details Fixture VY-1042

DESIGN (UI/UX)
Cancel booking is an outlined button, not red; red appears only on the final confirm. The policy and Contact support sit on the same screen.

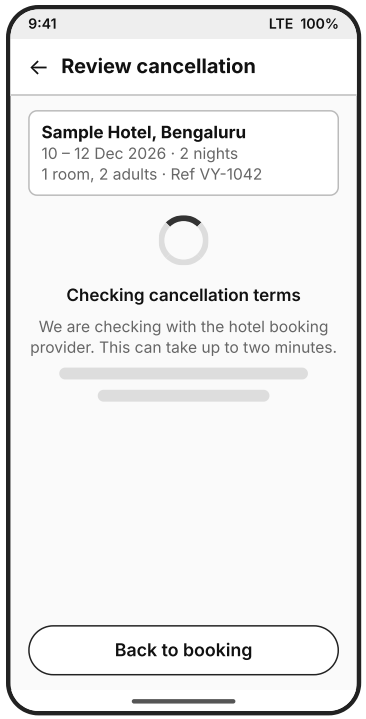

DEVELOPER (API)
D Booking Detail gives status (BookingConfirmed here), the text cancellationPolicy and isFeeWaiverAllowed. D Search cancellationDetail, saved at booking, is the structured policy behind the reminder. A Cancel shows only when the status allows it.

BUSINESS
The policy line reminds travelers of the deadline before they ask for a refund. It is a reminder only; the amount comes from Preview on the next step.

Wireframes C to F: Cancel Preview states

Same screen skeleton; three separate test fixtures drive the amounts

C Preview loading any booking

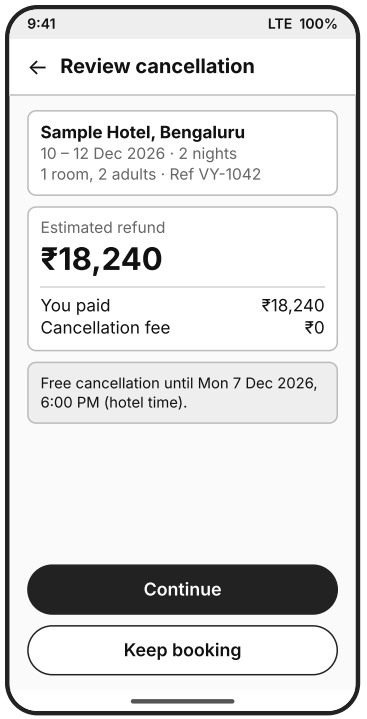

DESIGN (UI/UX)
Hotel and dates appear at once, then a plain waiting message. No countdown, since we do not know how long it will take. Back to booking stays available.

DEVELOPER (API)
D Cancel Preview takes {bookingId} and may take up to 120 seconds. A The backend owns the wait and keeps the request state, so closing the app does not restart it.

BUSINESS
No amount is shown until Agoda answers. A guessed refund would be a promise Voya may not be able to keep.

D Full refund VY-1042

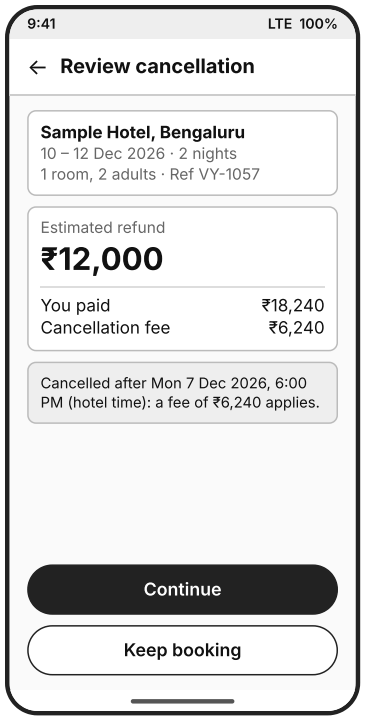

DESIGN (UI/UX)
Estimated refund is the largest figure and sits above Continue. Keep booking has equal weight so leaving is easy.

DEVELOPER (API)
D Preview returns cancellationSummary with refundRate, paymentRate, reference and cancellationPolicy. Store reference and refundRate for Confirm; do not recompute them on the phone. A Paid equals refund here only because we assume price parity.

BUSINESS
A/V Assumes Voya refunds what Agoda quotes. A Voya fee, coupon or currency difference must be settled before the traveler confirms.

E Partial refund VY-1057

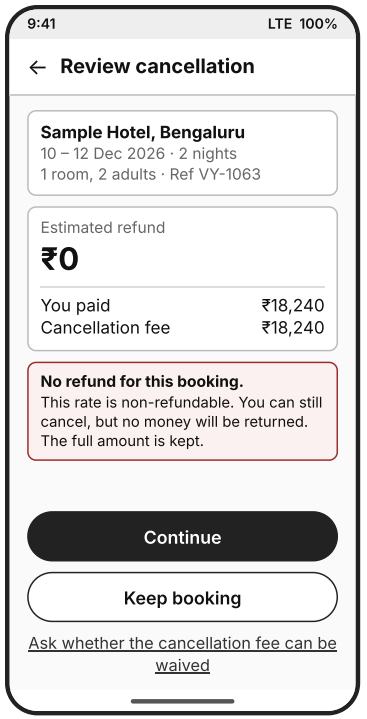

DESIGN (UI/UX)
Same layout as the full-refund state, so travelers learn it once. Fee and refund are separate lines so the loss is visible before Continue.

DEVELOPER (API)
D refundRate is lower than paymentRate. The fee line is the difference, computed for display only A. cancellationPolicy text explains why. Fixture VY-1057 with a simulated date after the penalty cutoff.

BUSINESS
A ₹12,000 is an invented test value. Voya shows the quote as given; disputes go to support, not into this flow.

F No refund, ₹0 VY-1063

DESIGN (UI/UX)
The screen says plainly that no money returns. Continue stays enabled because cancelling is still allowed. The waiver link appears only when it is permitted.

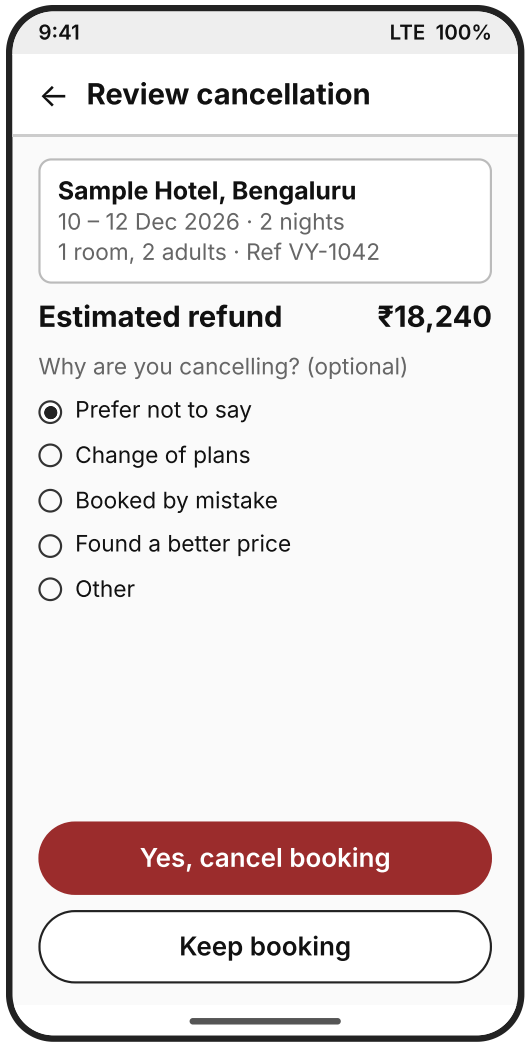

DEVELOPER (API)
D refundRate of 0 can still be confirmed with the same Confirm call. D The waiver link needs isFeeWaiverAllowed from Booking Detail, plus account permission V. Fixture VY-1063.

BUSINESS
Showing ₹0 before Continue avoids a complaint after the fact. A zero refund is not the same as a booking that cannot be cancelled.

Wireframes G and H: Final review and sending

Reason is optional; no biometric prompt

G Reason and final review VY-1042

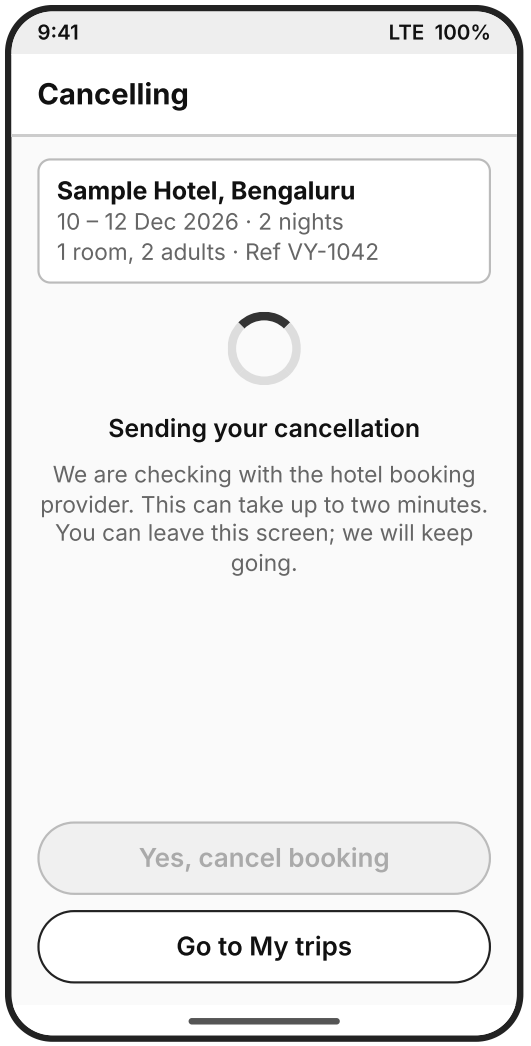

DESIGN (UI/UX)
Reason is optional and defaults to Prefer not to say. Hotel, dates and refund repeat so the wrong stay is not cancelled. Yes, cancel booking is the only red button; Keep booking sits right under it. No biometric prompt.

DEVELOPER (API)
D Confirm body: bookingId, reference, cancelReason, remark (optional) and refundRate {currency, inclusive}, copied from the latest Preview. Send cancelReason 0 when skipped; use only documented values. A Button disables on tap.

BUSINESS
Reason data is useful later and never blocks cancelling. A Voya's own request deduplication stops double taps; it does not make Agoda's Confirm exactly-once.

H Sending progress VY-1042

DESIGN (UI/UX)
Says which step is running, blocks a second tap and lets the traveler leave. The final button stays visible but disabled so nothing seems to have vanished.

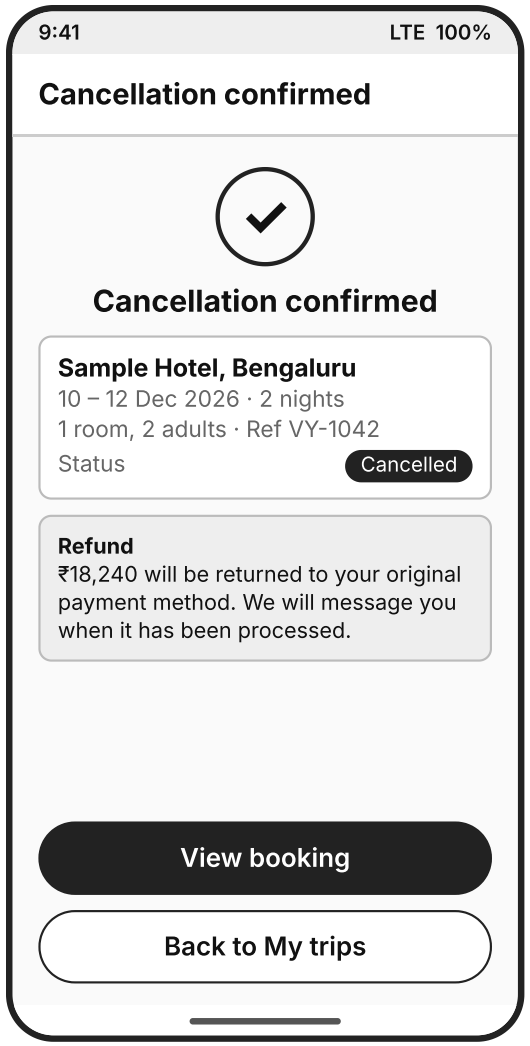

DEVELOPER (API)
D Confirm may take up to 120 seconds. A The backend records that Confirm was sent before the call, so a closed app can recover by reading Booking Detail.

BUSINESS
The backend, not the screen, owns the request. A traveler who leaves cannot trigger a second cancellation.

Wireframes I and J: Confirmed and outcome unknown

Cancelling the booking and refunding the money are separate things

I Cancellation confirmed VY-1042

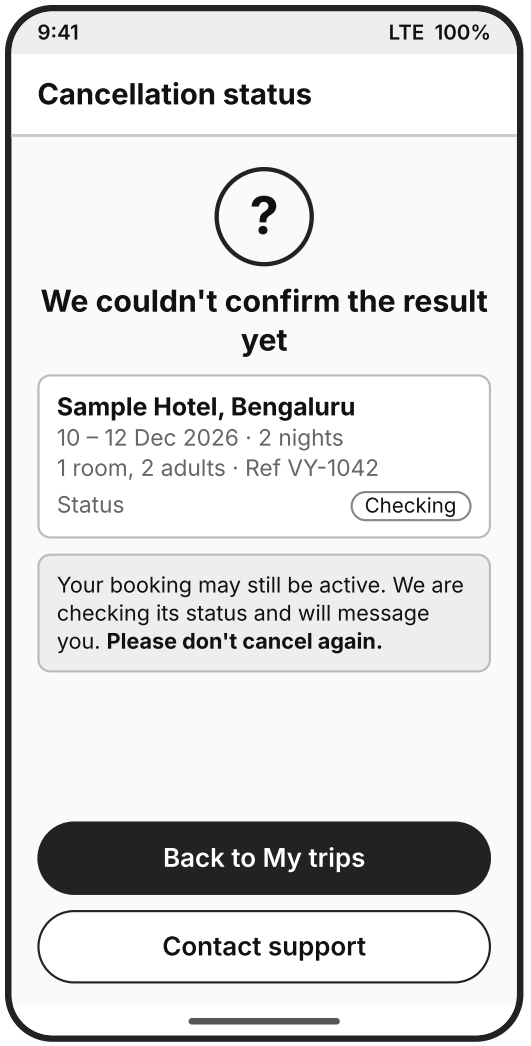

DESIGN (UI/UX)
The headline says Cancelled and repeats hotel, dates and reference. Refund wording gives no number of days. View booking opens the cancelled record.

DEVELOPER (API)
`D` A successful Confirm is HTTP 200 with an empty body. Voya then reads Booking Detail and shows this screen only when the status is cancelled `V: confirm exact status in sandbox`.

BUSINESS
`A` Cancelling the booking and returning money are separate: the payment gateway sends the refund. Agoda does not document refund timing under Partner Fulfillment `V`.

J Result not confirmed yet after a timeout

DESIGN (UI/UX)
Neither success nor failure. It says the booking may still be active, that we are checking, and asks the traveler not to cancel again. Support is one tap away.

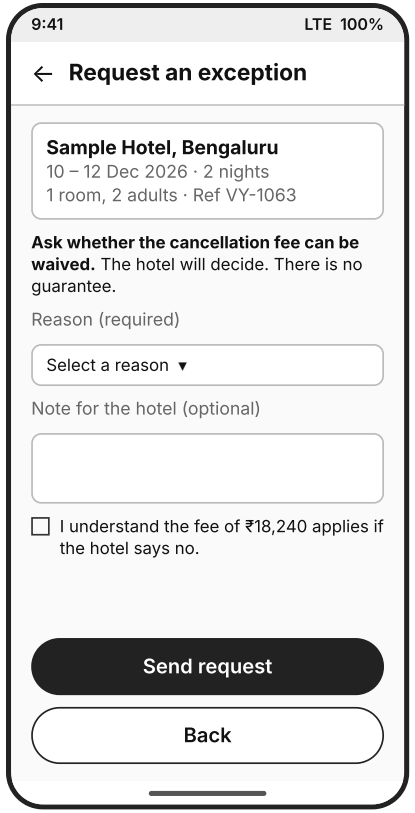

DEVELOPER (API)
`D` No reply in time does not mean cancelled. The backend reads Booking Detail first and asks for a fresh Preview only if the booking is still active. `A` Traveler is notified when the check finishes.

BUSINESS
Prevents duplicate cancellations and false cancelled messages. Support starts with the reference already attached.

Wireframes K to M: Fee waiver request

Conditional exception path. The hotel decides; nothing is promised

K Request an exception VY-1063

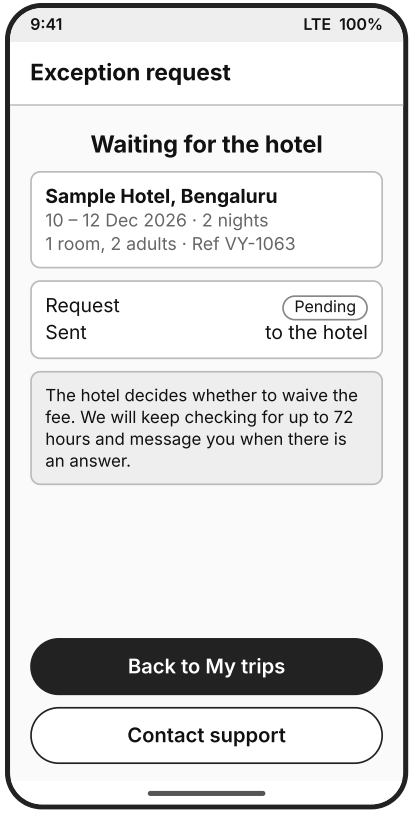

DESIGN (UI/UX)
Plain wording that the hotel decides. A required reason, an optional note and a checkbox so the traveler knows the fee stands if the hotel says no.

DEVELOPER (API)
D Confirm with requestingFeeWaiver true, feeWaiverReason and remark, only when isFeeWaiverAllowed. V Reason values differ between the guide and the Appendix; account permission may block it (error 924). A The cancellation goes with the request.

BUSINESS
The hotel carries the decision, not Voya, so copy must not promise a waiver. V Who tells the traveler when the answer arrives.

L Pending VY-1063

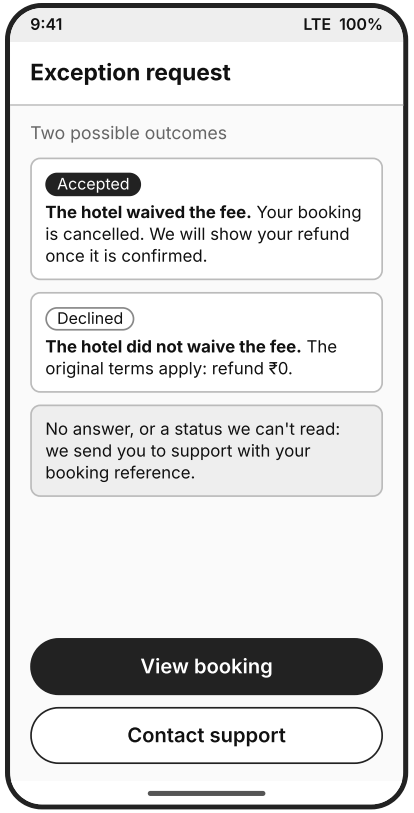

DESIGN (UI/UX)
One clear status, Pending, and how long we will keep checking. No progress bar, because the hotel sets the pace.

DEVELOPER (API)
D Poll Booking Detail feeWaiverStatus for up to 72 hours, not past 12:00 AM on the check-in date. Sandbox hotel 42976 stays pending, then accepts after 24 hours. V Booking status while pending.

BUSINESS
Polling and messages cost engineering time, and the 72-hour limit is documented. Support gets the case if there is no answer.

M Accepted or declined VY-1063

DESIGN (UI/UX)
Two outcomes in one panel, each stating what happens next. Accepted: fee waived. Declined: original terms. No celebration styling. Anything unreadable goes to support.

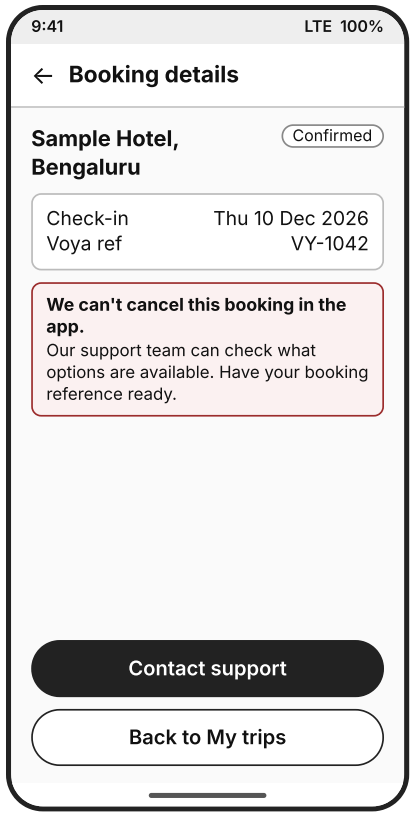

DEVELOPER (API)
D feeWaiverStatus Accept or Reject. V The guide also lists Cancelled and AutoReject; the Appendix lists Timeout. Treat those as Ask support. Verify Booking Detail before saying cancelled.

BUSINESS
A A declined waiver means the original terms stand. Confirm with Agoda that the booking stays cancelled in that case.

Wireframes N to P: Cannot cancel, already cancelled, failure

Three different decisions, not three error screens

N Cannot cancel in app VY-1042

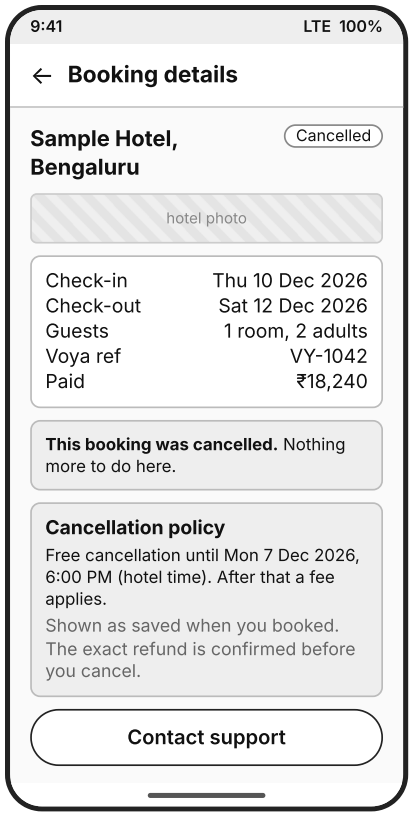

DESIGN (UI/UX)
One sentence on what happened and a direct way to reach support. The error code is never shown. The reference is already on screen.

DEVELOPER (API)
A Voya decides assisted cancellation from Booking Detail status or a check-in date too close to the cutoff. V The boundary: one day before check-in, or 12:00 AM on the check-in date. Support ticket creation is a design assumption.

BUSINESS
Manual cancellations use support time. Settling the cutoff with Agoda decides how many bookings end up here.

O Already cancelled VY-1042

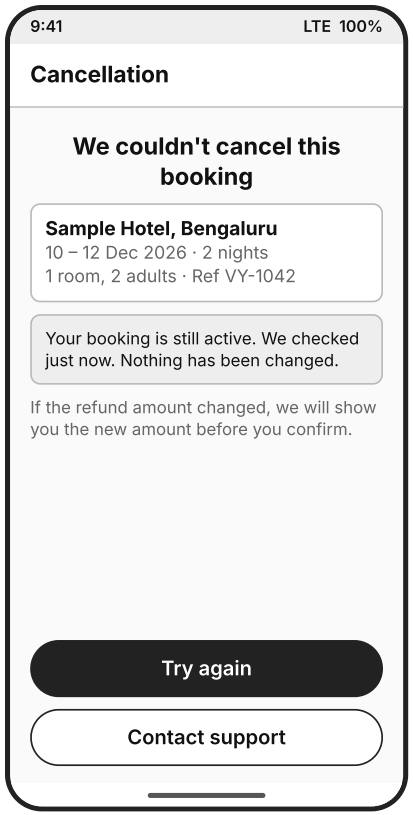

DESIGN (UI/UX)
The Cancel button is gone and the status is at the top. Dates and policy remain for reference. Contact support is still there.

DEVELOPER (API)
D Booking Detail status BookingCancelled or BookingCancelledByCustomer means Preview and Confirm are not called. A Refund status shown here comes from Voya's own records.

BUSINESS
Saves needless API calls and avoids double-cancel confusion.

P Could not cancel VY-1042

DESIGN (UI/UX)
States the booking is still active only because Booking Detail says so. Try again starts over with a new quote; support is the fallback.

DEVELOPER (API)
D Retryable errors (HTTP 500, 429): recheck Booking Detail, then a fresh Preview. Refund mismatch 914: new Preview, show the new amount. Auth or permission errors (102, 401, 403): log, do not loop. A Travelers never see codes.

BUSINESS
Keeps operations alerts separate from traveler wording. Repeated failures move the booking to the assisted path.

API-to-screen map and key scenarios

What each screen reads or sends, and the ten cases we chose to show

Screen	Source	Fields and notes	Evidence
A	Voya booking table; Booking List to reconcile	Voya ref, Agoda bookingId, tag	A/D
B, O	Booking Detail; saved Search cancellationDetail	status, cancellationPolicy text, isFeeWaiverAllowed; structured policy	D
C to F	Cancel Preview	cancellationSummary: reference, paymentRate, refundRate, cancellationPolicy	D
G, H, I	Cancel Confirm, then Booking Detail	bookingId, reference, cancelReason, refundRate; HTTP 200 empty body	D
J	Booking Detail	status recheck before any retry	D/A
K to M	Confirm with requestingFeeWaiver; Booking Detail	feeWaiverReason, remark, feeWaiverStatus	D/V
N, P	Voya rules; documented errors	errorMessage id and subId (102, 914); support ticket is Voya's	D/A
Refund payment	Voya payment gateway	not an Agoda call	A

Open questions for Agoda V

- Cancellation cutoff: one day before check-in, or 12:00 AM on the check-in date
- Fee-waiver reason values and status names differ between the guide and the Appendix
- Whether the booking is cancelled while a waiver is pending
- How and when the traveler's refund settles under Partner Fulfillment
- Account permission for Preview, Confirm and fee waiver

Ten scenarios shown

1. Full refund before the penalty cutoff (D)
2. Partial refund with the fee shown (E)
3. ₹0 refund; cancelling still allowed (F)
4. Already cancelled; no Confirm sent (O)
5. Ineligible status or too close to check-in: support (N)
6. Preview slow or failing: no quote shown (C)
7. Confirm times out: recheck Booking Detail first (H, J)
8. Refund mismatch, error 914: fresh Preview (P)
9. Waiver not allowed: no waiver link (F without link)
10. Waiver pending, then accepted or declined (L, M)

Ten of the twenty cases we identified. The rest (wrong account, quote changes after display, multi-room, refund payment delay, app closed mid-call) are handled by the same rules and kept in the team's working matrix.

Checks run on this document

- Weekdays verified: 25 Oct 2026 Sunday; 7 Dec Monday; 10 Dec Thursday; 12 Dec Saturday
- Every wireframe has Design, Developer and Business notes
- No endpoint paths or response fields beyond Agoda's documentation

Product note (1 of 2)

Voya hotel cancellation on Android

Problem and scope

Voya is an Android app that sells hotel rooms sourced from Agoda. A traveler who booked through Voya should be able to cancel from the app and know what it will cost before agreeing. This note covers version 1: full cancellation of one confirmed booking, started from My trips. We assume Voya works under Agoda's Partner Fulfillment model, where Voya takes the payment and handles service after the sale. Date changes, cancelling one room out of several, no-show disputes and the payment system that returns money to the traveler are not designed here. Every hotel, price and date in the wireframes is made-up test data.

How the flow works

The traveler opens My trips and picks a booking. Voya already stores its own reference next to Agoda's bookingId, and before showing the Cancel booking button the backend reads the current status from Agoda's Booking Detail. If the booking is already cancelled, or its status does not allow self-service cancellation, the button is replaced by the existing status or a route to support.

Tapping Cancel booking makes the backend call Cancel Preview. Agoda returns a reference, the policy text, what was paid and what would be refunded. Voya shows those figures beside the hotel name and dates and asks for a clear yes or no. Only then does the backend send Confirm, using the reference and refund amount from that preview. A successful Confirm returns HTTP 200 with an empty body, so Voya does not wait for a field that says what happened. It reads Booking Detail again and shows Cancellation confirmed when the status says cancelled.

The policy text on Booking details comes from the structured cancellation data in the Search response, saved when the traveler booked. It is a reminder and not a quote. Deadlines and amounts can change, so Preview is the only source for the figure on the review screen.

Why the screens are in this order

The refund appears before the destructive button because it is the number the traveler is deciding on. Hotel and dates repeat on the review screen so someone with several trips does not cancel the wrong one. Keep booking is always one tap away. We left out a biometric prompt and a long survey. Neither protects the traveler from a wrong decision, and the reason question is optional, sent as code 0 when skipped. The confirmation screen says the booking is cancelled and a refund is on its way, but gives no number of days, because Agoda's documentation does not say when the traveler's money comes back under Partner Fulfillment.

Product note (2 of 2)

Exceptions, trade-offs and what is left to confirm

Exceptions

A refund of zero is not the same as a booking that cannot be cancelled. A non-refundable rate can still be cancelled through the API; the traveler gets nothing back, and the screen says so before Continue. Separately, the date after which the API refuses a cancellation is not the date a penalty starts. The two Agoda pages we read give different boundaries for that cutoff: one day before check-in in the cancellation guide, and midnight at the start of the check-in date in the certification guide. Until Agoda confirms, version 1 sends anything close to check-in to support.

Both Preview and Confirm can take up to 120 seconds, so each has its own waiting screen that blocks a second tap. If Confirm times out, we do not know whether it went through, so the backend reads Booking Detail first and asks for a fresh Preview only if the booking is still active. If Agoda rejects Confirm because the refund no longer matches the quote (the documented example is error 914), the app shows the new amount and asks again. Authentication and permission errors are logged and never shown to the traveler as codes.

Fee waiver is a separate path, offered only when Booking Detail shows isFeeWaiverAllowed and Voya's account has permission. The traveler asks, the hotel decides, and Voya checks Booking Detail for the answer for up to 72 hours, but not past check-in. The screens never promise a waiver. The documentation lists different reason values and statuses in two places, so we mark them for validation.

Assumptions and trade-offs

In the examples Voya refunds the traveler the amount Agoda quotes, which assumes the traveler paid what Agoda charges Voya. A markup, coupon, currency conversion or gateway fee would break that and needs a business decision. Returning money to the traveler is the payment gateway's job, so the app tracks booking status and refund status separately. Reading Booking Detail after every Confirm adds a call and slows the result screen a little; we accept that to avoid showing a cancellation that did not happen.

What to measure after launch

We would track the share of eligible bookings cancelled in the app, the drop-off between seeing a quote and confirming, Preview and Confirm timeout and error rates, the time to show the first quote, the share of cancellations that go to support, and refund questions after cancellation. We have no baseline for any of these yet.

Still to confirm with Agoda

Our account permissions for Preview, Confirm and fee waiver; the exact cancellation cutoff; the fee-waiver reason values and status names; how and when the traveler's refund settles; and who at Voya owns manual cancellations.
